

Study of ZH recoil mass

Kazutoshi Ito
Tohoku Univ.
5 Mar 2008

Introduction

- **Motivation**

- $e^+ e^- \rightarrow ZH \rightarrow l^+ l^- H$ is golden channel for measurement of Higgs Mass and coupling of ZH.

- **Today's topic**

- Using $e^+ e^- \rightarrow ZH \rightarrow \mu^+ \mu^- H$, reconstruction of recoil mass distribution.
- Estimation of the measurement accuracy for the ZH cross-section and Higgs mass at GLD and GLD'.

Simulation setup

Simulation setup

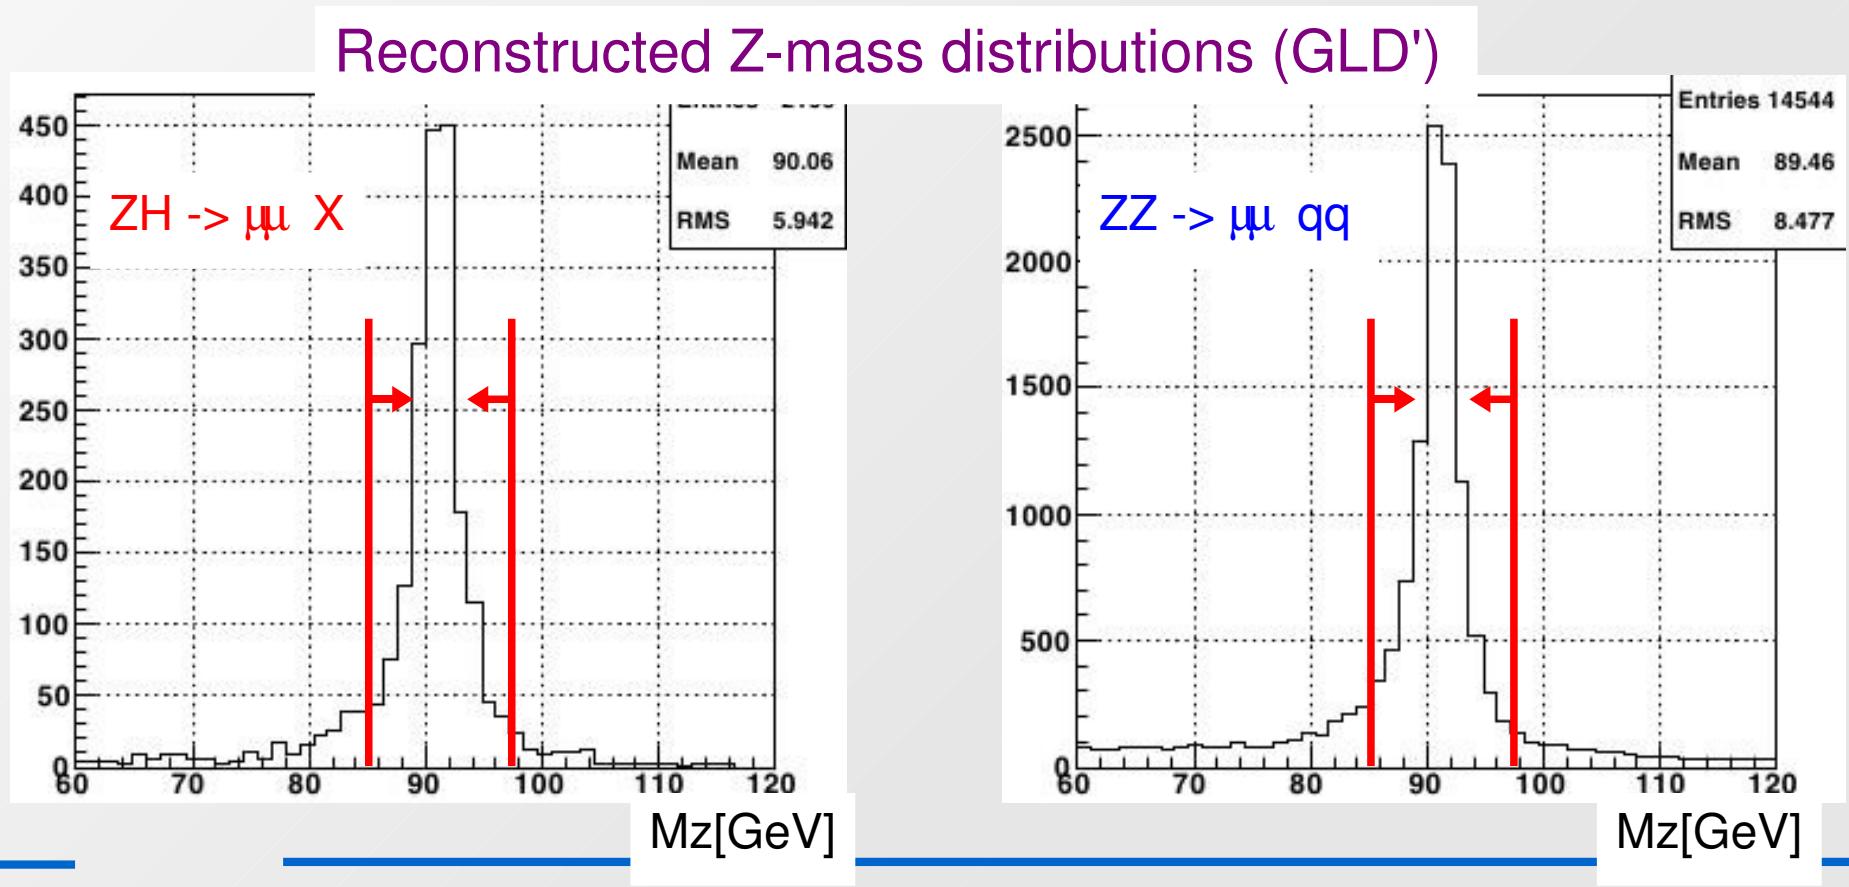

- Full-simulator : Jupiter (GLD and GLD')
- Reconstruction : MarlinReco
(event reconstruction)
 - LCIO-file is converted to ROOT-file by interface program.
- Analysis : ROOT
- CM energy : 250 GeV
- Higgs mass : 120 GeV

Analysis outline

- **data samples**
 - signal : ee \rightarrow ZH \rightarrow $\mu\mu X$
 - ✓ Luminosity : 335 fb^{-1} (2500 events)
 - B.G. : ee \rightarrow ZZ \rightarrow $\mu\mu qq$
 - ✓ Luminosity : 252 fb^{-1} (20000 events)
 - ✓ The number of events are scaled to 335 fb^{-1} .
- **Analysis procedure**
 1. Selection of 2 muon tracks from Z.
The tracks have the least χ^2 value for M_Z .
 2. Selection of well-reconstructed events.
 3. Reconstruction of Higgs recoil mass.
 4. Estimation of measurement accuracy for $\sigma(\text{ZH})$ and M_H .

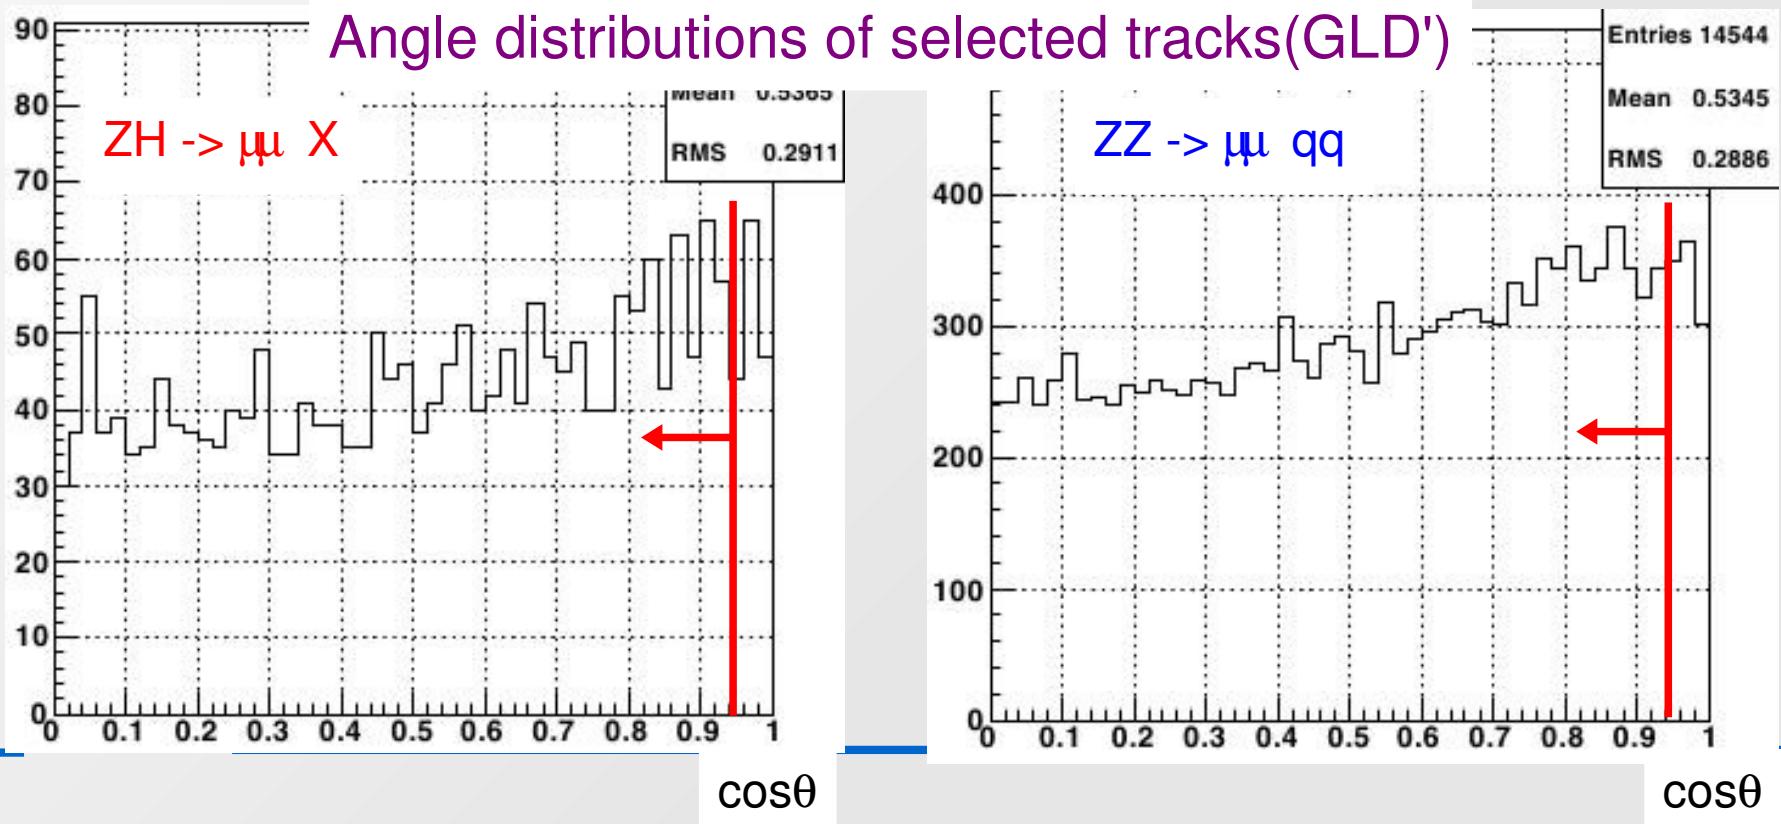

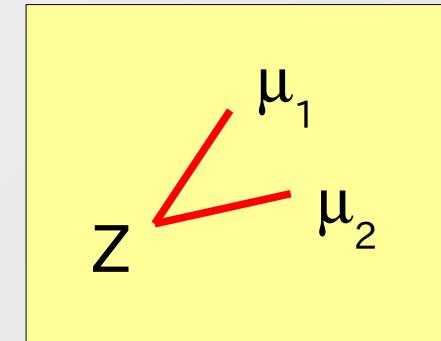

Reconstructed M_Z cut

- **M_Z is reconstructed with the selected two muon tracks.**
- **Events with M_Z of 85 – 97 GeV are selected.**
 - The cut corresponds to 3 sigma range of the distributions.

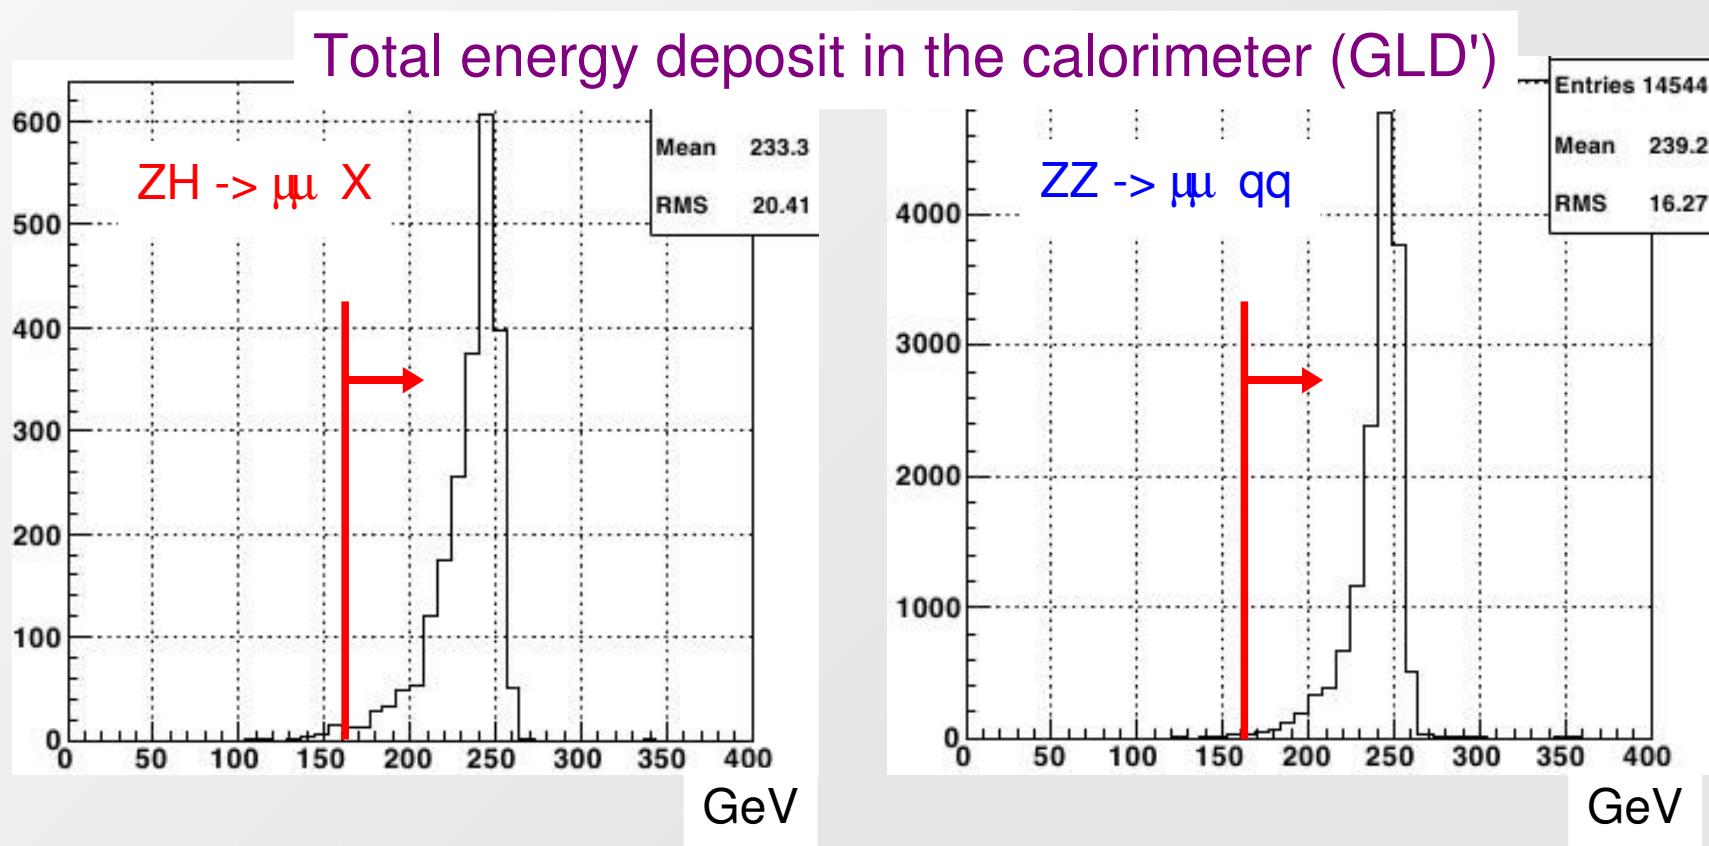

Track angle cut

- The track angle cut is applied for two muon tracks to select well reconstructed tracks.
 - TPC coverage : $\cos\theta < 0.98$
 - The track angle is required to be $\cos\theta < 0.95$

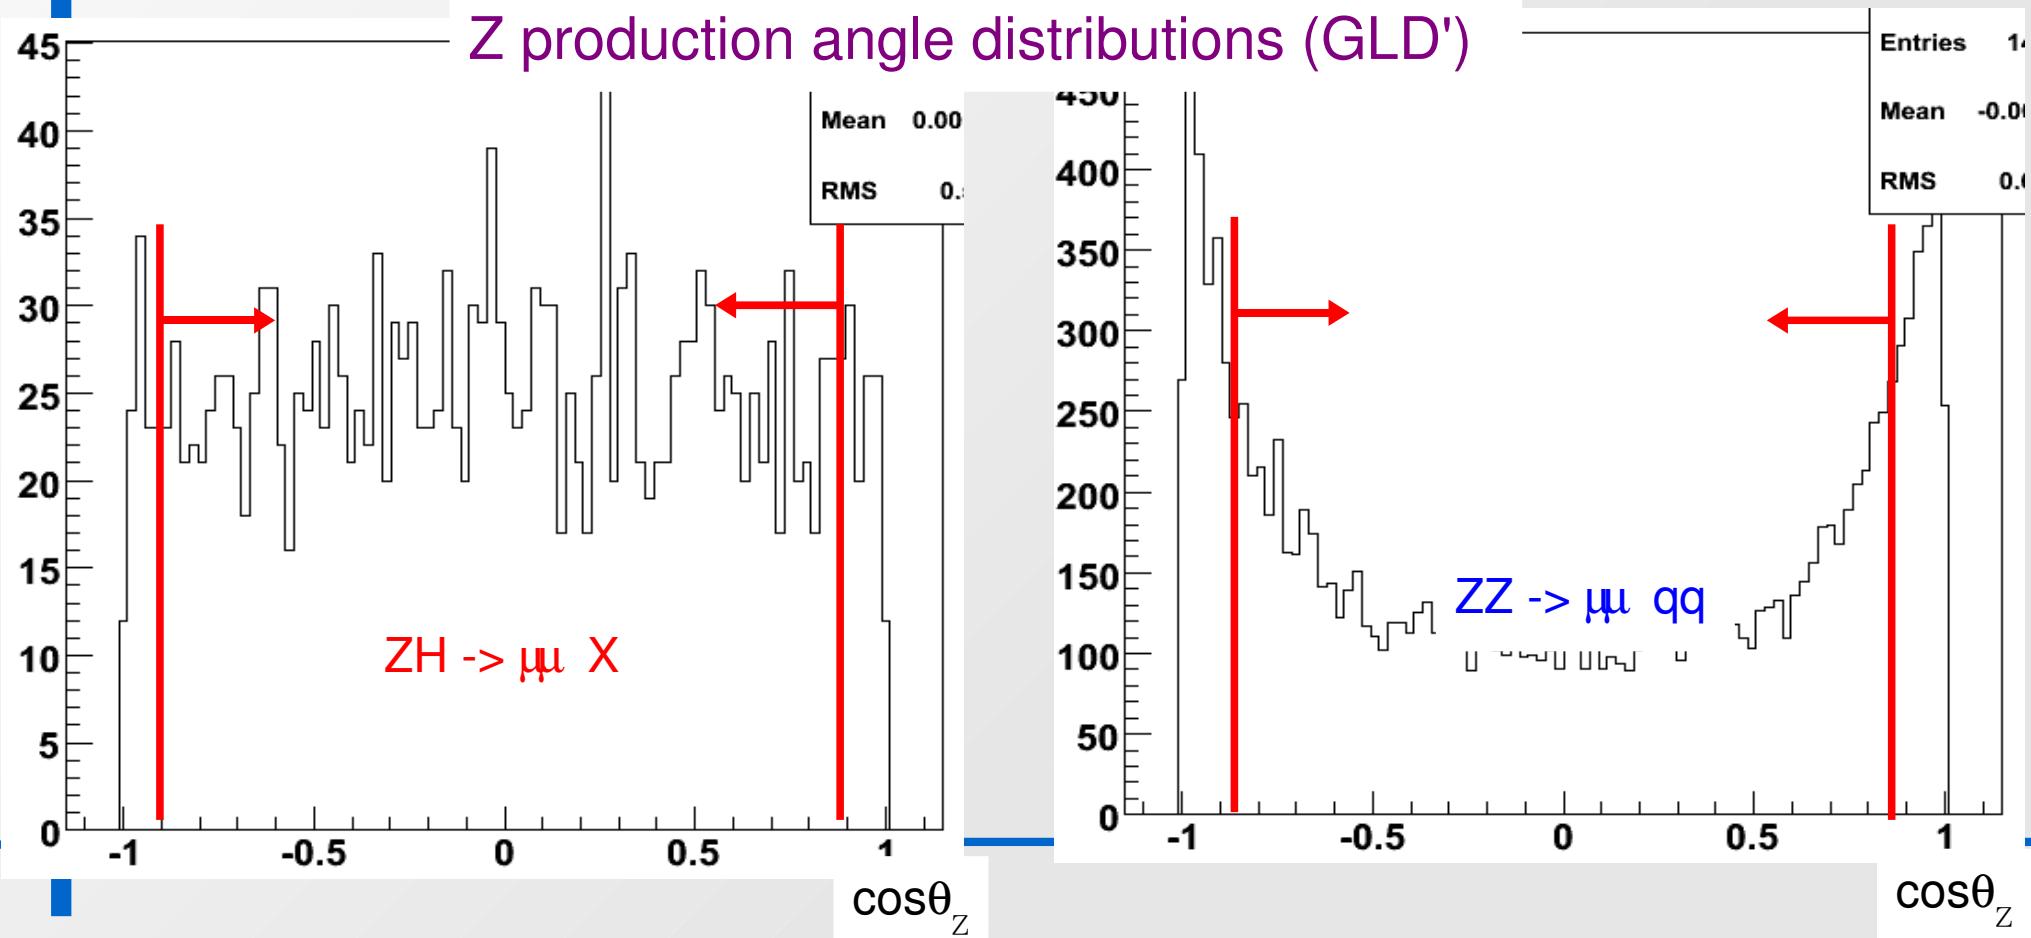

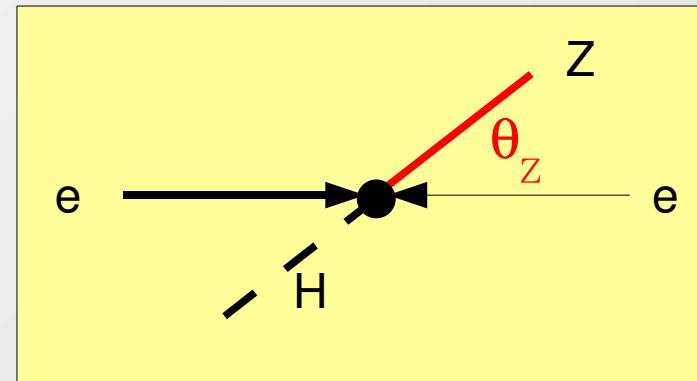

Cut for total energy deposit

- The total energy deposit in the calorimeter is checked.
- The event of total energy above 160GeV is selected.
 - $E_{CM} - M_Z \sim 160\text{GeV}$

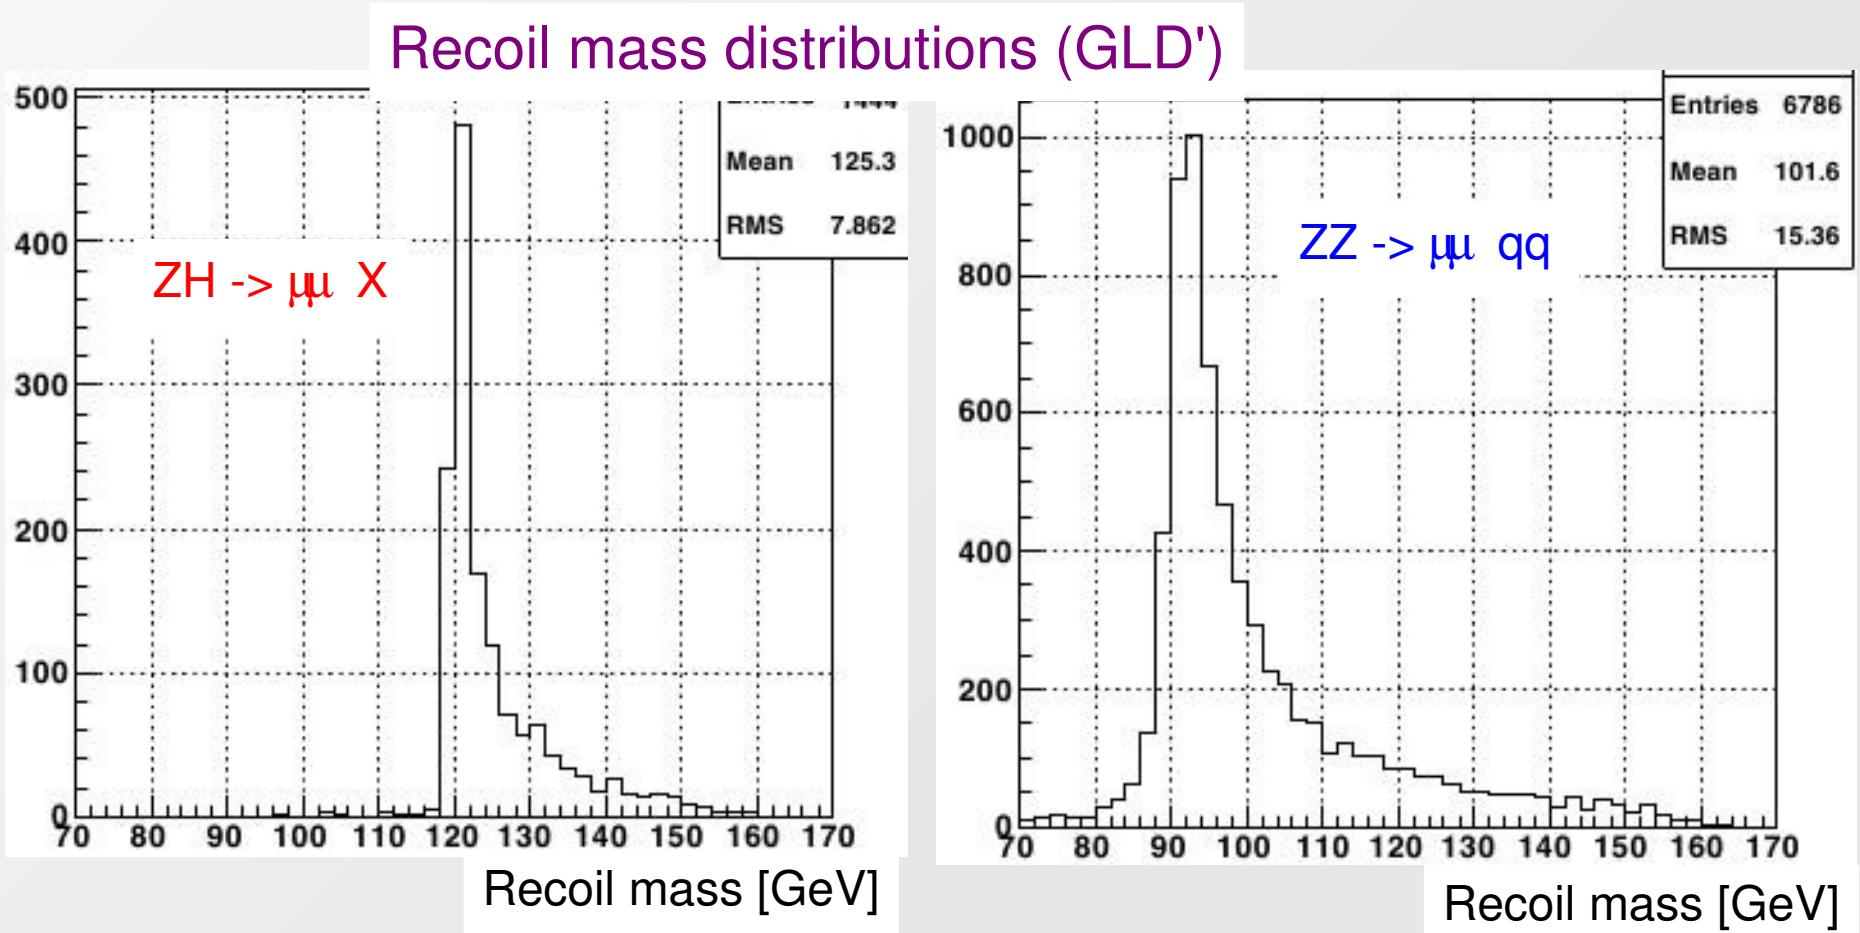

Z production angle cut

- The Z production angle cut is applied.
 - The Events in the range of $-0.88 < \cos\theta_z < 0.88$ are selected.

Reconstructed recoil mass

- The recoil mass is reconstructed after all the cuts.
 - A peak is observed at 120 GeV for the signal events.
 - There is a tail from the $e^+e^- \rightarrow ZZ$ at Higgs mass.

Reduction summary

- The reduction rate is summarized for each cut.
 - Luminosity : 335fb^{-1}

	GLD' $ZH \rightarrow \mu\mu Z (ZZ \rightarrow \mu\mu qq)$	GLD $ZH \rightarrow \mu\mu Z (ZZ \rightarrow \mu\mu qq)$
No cut	2,500(26,500)	2,500(26,500)
2 muon tracks from Z	2,199(19,271)	2,246(19,515)
$85\text{GeV} < M_Z < 97\text{GeV}$	1,817(13,118)	1,857(13,273)
$\cos\theta < 0.95$	1,625(11,921)	1,668(12,122)
Total energy $> 160\text{GeV}$	1,610(11,906)	1,656(12,104)
$\cos\theta_Z < 0.88$	1,444(8,991)	1,482(9,099)

- Signal acceptance : $\sim 58\%$
- B.G. acceptance : $\sim 34\%$

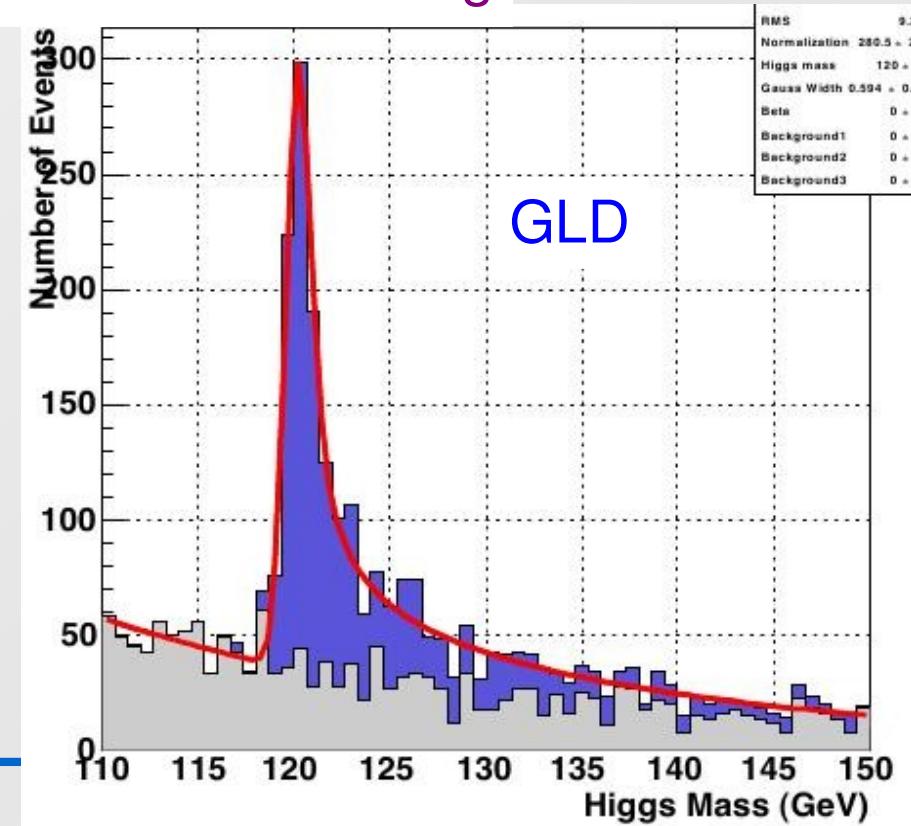

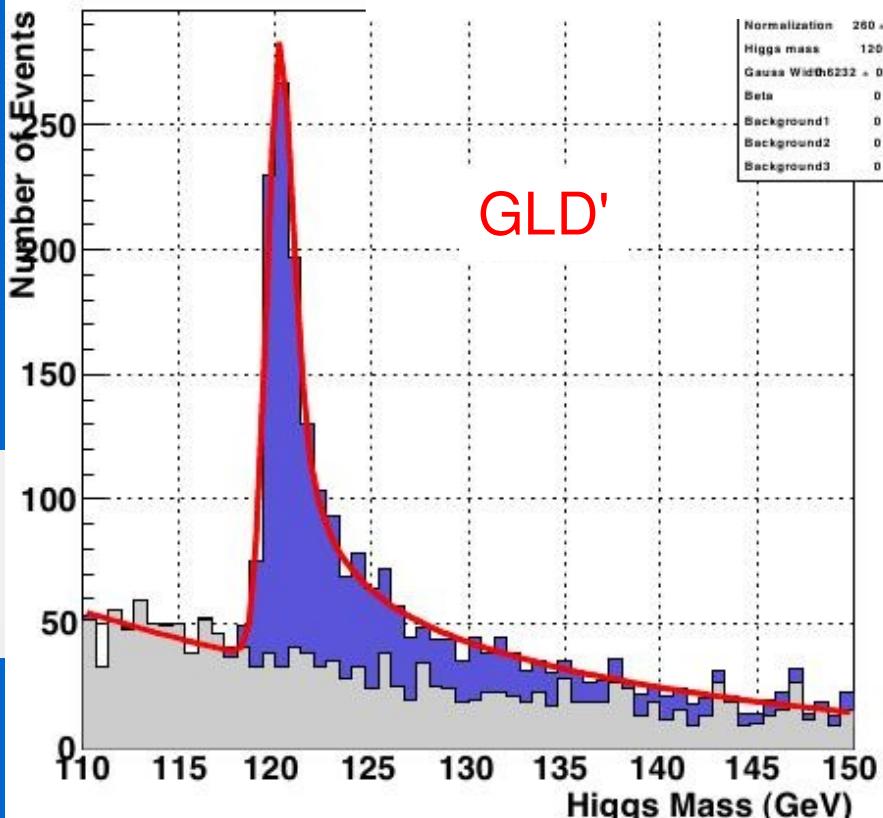

Fitting function

- The distribution of the recoil mass is fitted by a function:

$$F(m) = N_H \int F_H(m, t) e^{\frac{-t^2}{2\sigma^2}} dt + F_Z(m)$$

$$\left[F_H(m, t) = \left(\frac{m+t-M_h}{\sqrt{s}-M_h} \right)^{-\frac{1}{2}} \right]$$
$$\beta = \frac{2\alpha}{2\pi \log \sqrt{s}/m_e - 1}$$

Recoil mass distributions after the fitting

Estimation of measurement accuracy

Measurement accuracy of $\sigma(ZH)$ and M_H is evaluated from the fitting result.

- **Measurement accuracy for 335fb^{-1}**
 - ZH cross-section : 3.1% (for GLD')
3.0% (for GLD)
 - Higgs mass : 40.8MeV (for GLD')
37.9MeV (for GLD)

The resolution of Higgs mass deteriorates for GLD', because tracking accuracy of GLD' is worse than GLD.
To be checked!

Summary

- Study of ZH recoil mass is ongoing for GLD' and GLD.
- The recoil mass distribution is reconstructed after the selection cuts.
 - M_z , track angle, total energy and production angle
- The measurement accuracy of ZH cross-section and Higgs mass is estimated for 335fb-1.
 - Cross-section : 3.1%(GLD'), 3.0%(GLD)
 - Higgs mass : 40.8MeV(GLD'), 37.9%(GLD)
- The reason of worse cross-section and Higgs mass resolution for GLD' should be checked.

Decision of production angle cut
