

# Study of $ZH$ recoil mass

Kazutoshi Itoh  
Tohoku university  
11<sup>th</sup> Jun 2008

## Introduction

- **Motivation of recoil mass study**
  - $e^+e^- \rightarrow ZH \rightarrow l^+l^- X$  is the golden channel for measurement of Higgs mass and coupling of ZH.
  - This mode is useful for the detector optimization.

- **Today's topic**
  - Reconstruction of recoil mass distribution.
  - Estimation of the measurement accuracy for the ZH cross section and Higgs mass.

## Simulation setup

### Setup

- Full-simulator : Jupiter
  - detector : GLD, GLD' and J4LDC
    - J4LDC : LDC like geometry in Jupiter.
- Reconstruction : MarlinReco (event reconstruction)
  - LCIO-file is converted to ROOT-file by the interface program.
- Analysis : ROOT

### Detector geometry

		GLD	GLD'	J4LDC
VTX	Rin (mm)	17.50	1.60	1.50
	Rout (mm)	60.00	60.00	60.00
TPC	Rin(m)	0.40	0.40	0.30
	Rout(m)	2.06	1.80	1.58
	Zmax(m)	2.60	2.35	2.16
B-Field(T)		3.00	3.50	4.00

## Data sample

- CM energy : 250 GeV
- Initial beam energy spread :
  - gauss distribution ( $\sigma(e^-)=0.28\%$ ,  $\sigma(e^+)=0.18\%$ )
  - Previous study (TILC08) : uniform distribution ( $\sigma(\Delta E/E)=0.05\%$ )
- signal : ee  $\rightarrow$  ZH  $\rightarrow$  ee/ $\mu\mu X$ 
  - Luminosity :  $670 \text{ fb}^{-1}$  (5000 events)
- B.G. : ee  $\rightarrow$  ZZ  $\rightarrow$  ee/ $\mu\mu qq$ 
  - Luminosity :  $252 \text{ fb}^{-1}$  (20000 events)

**The number of events are scaled to  $250 \text{ fb}^{-1}$ .**

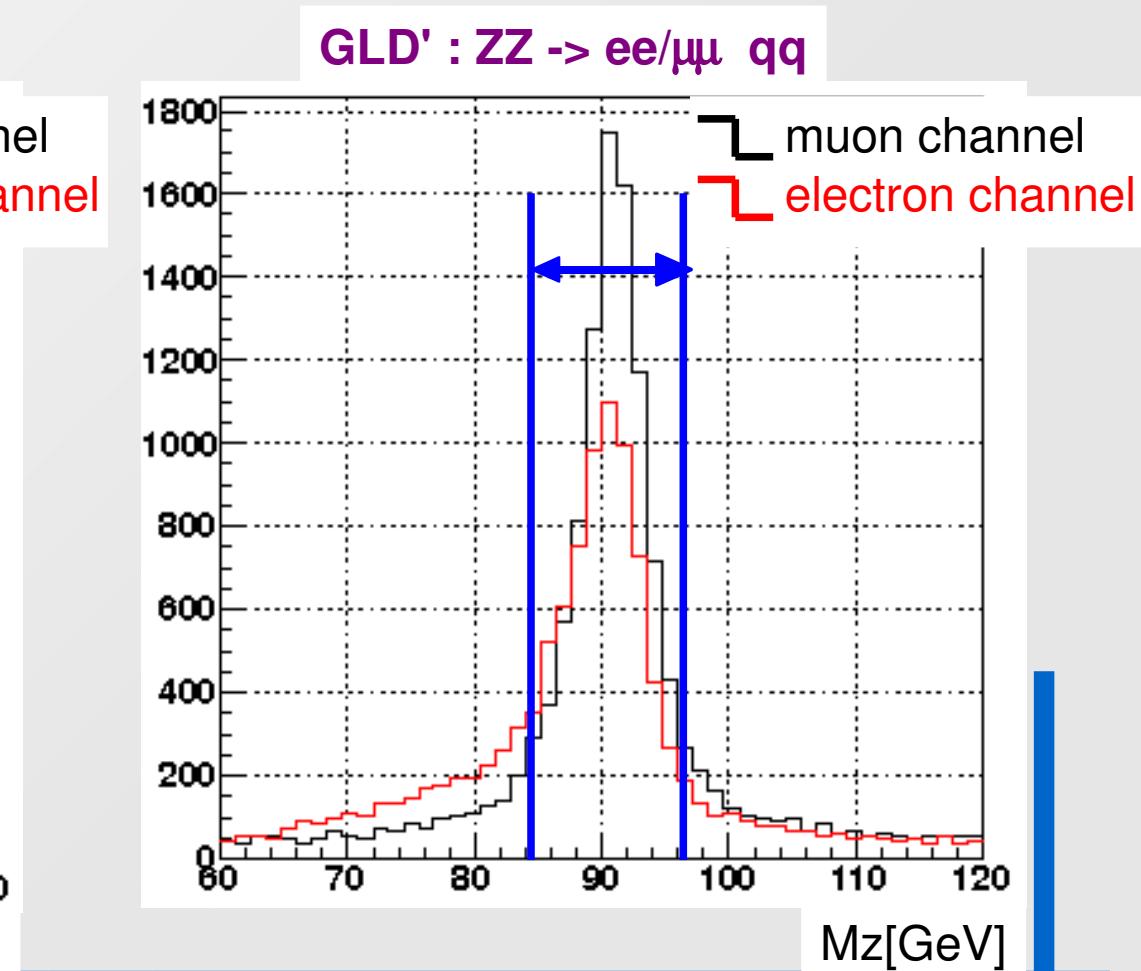

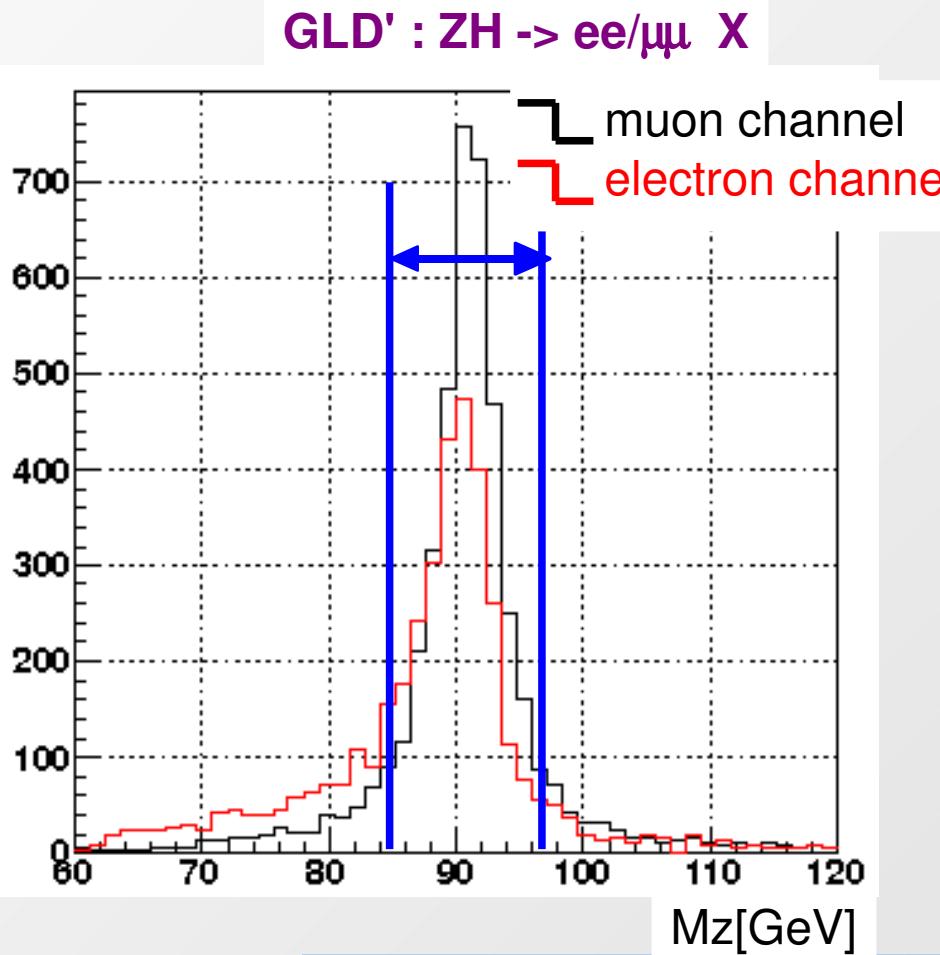

## Analysis outline

1. Selection of 2 lepton tracks from Z.
  - Two tracks with the highest energy were selected.
2. Selection of well-reconstructed events.
3. Reconstruction of Higgs recoil mass.
4. Estimation of measurement accuracy for  $\sigma(ZH)$  and  $M_H$ .

**The selection of well-reconstructed events are shown.**

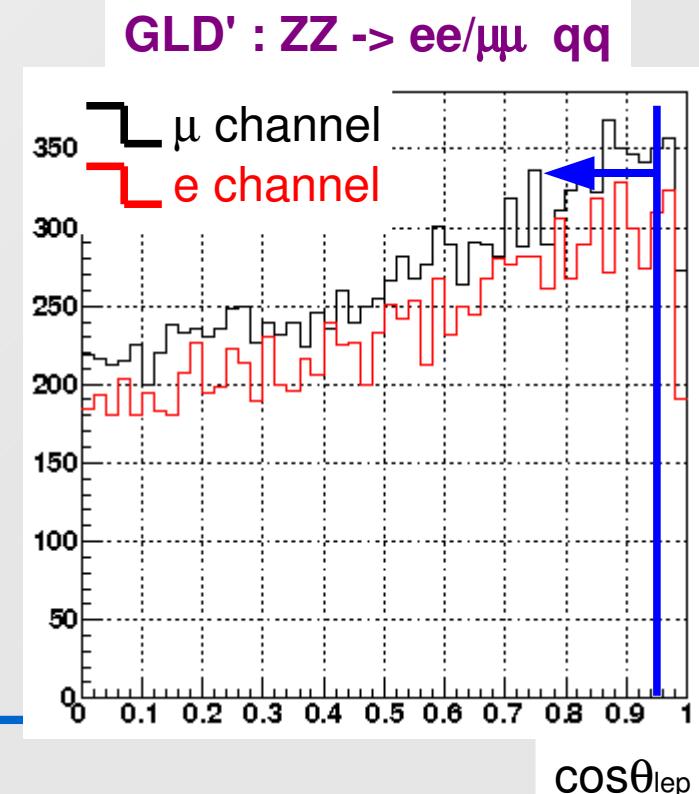

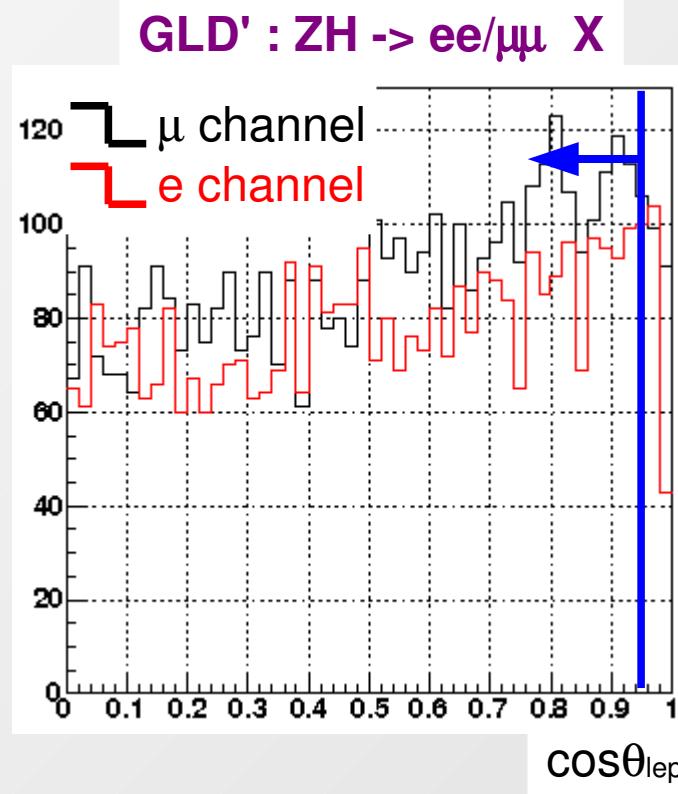

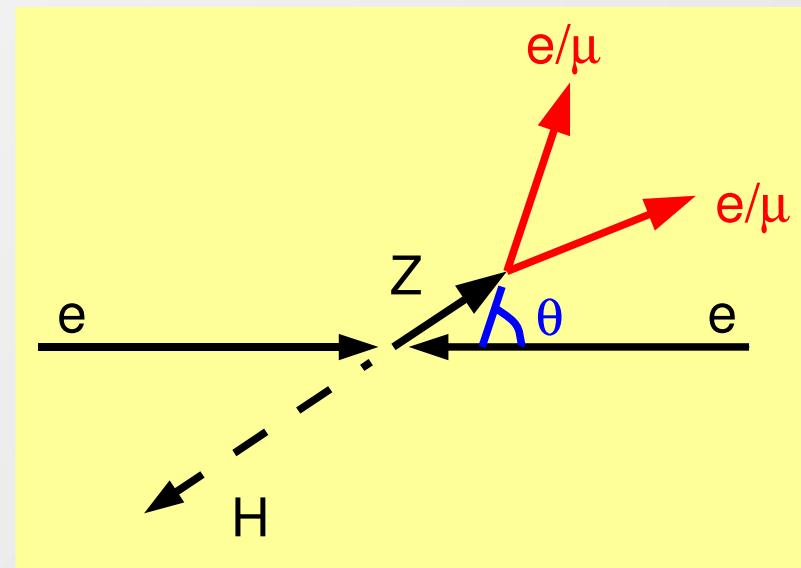

## Reconstructed $M_z$ cut

- **M<sub>z</sub> is reconstructed with the selected two lepton tracks.**
- **Events with M<sub>z</sub> of 85-97 GeV are selected.**
  - The cut corresponds to 3 sigma range of the distributions.

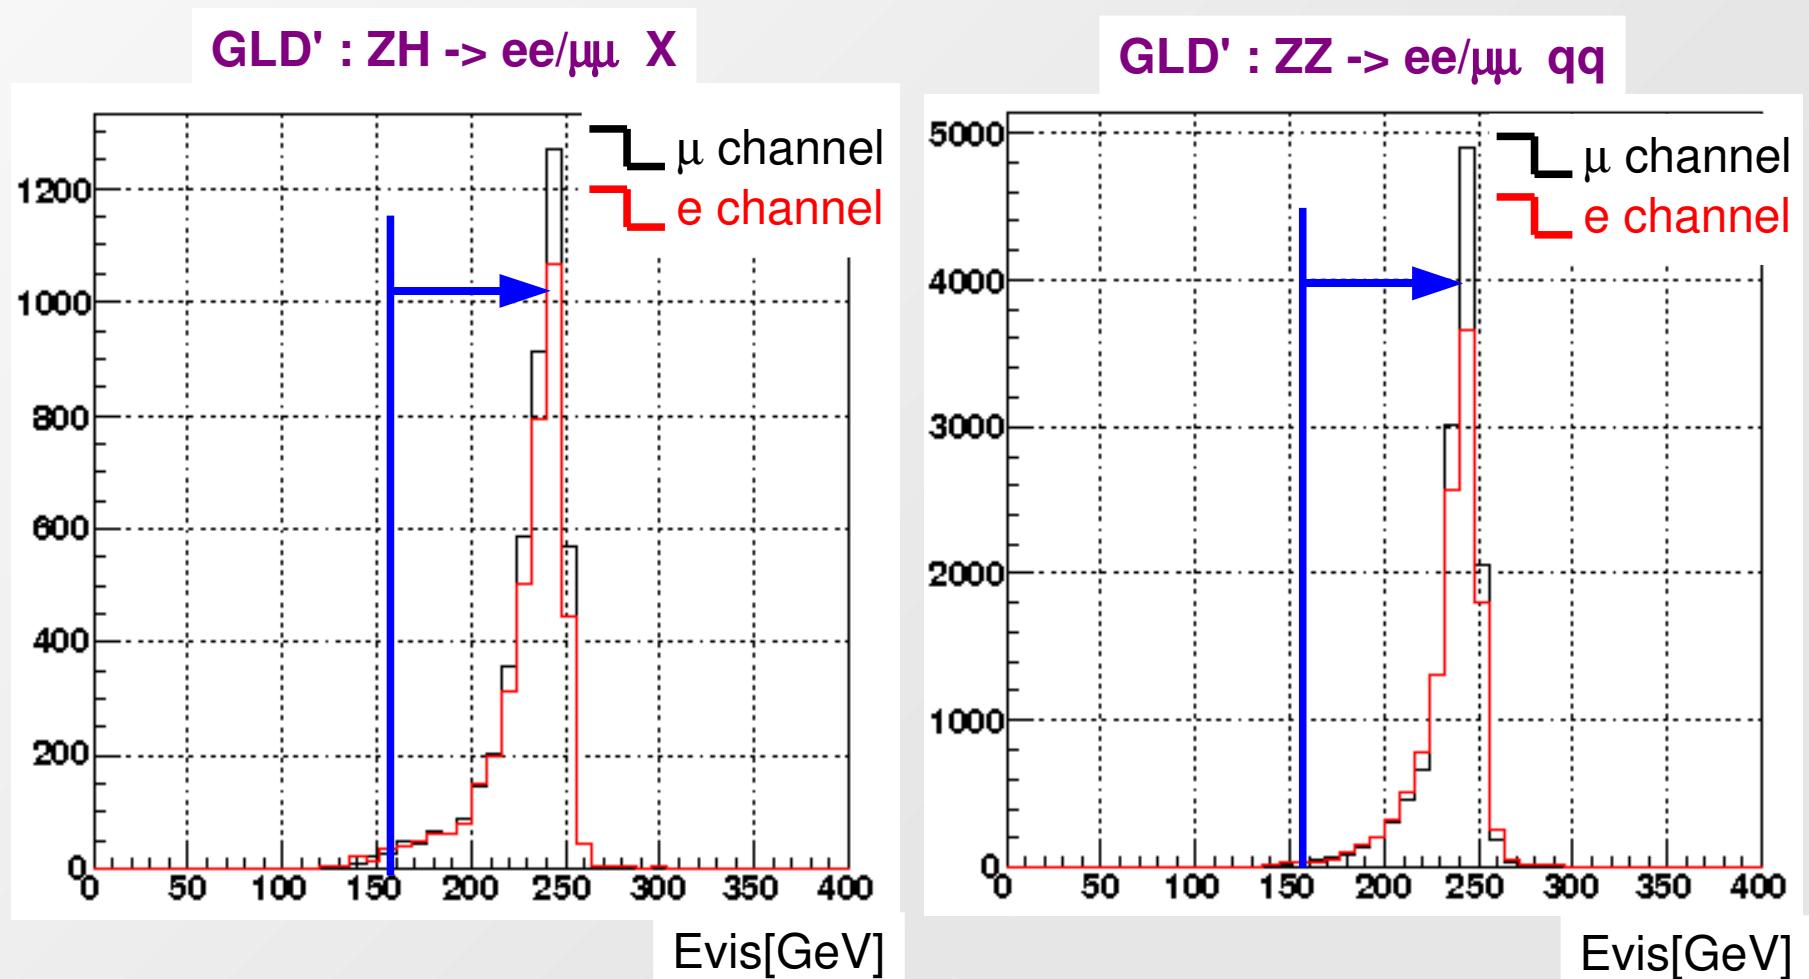

## Track angle cut

- The angular cut is applied to two lepton tracks for selection of well reconstructed tracks.
  - TPC coverage :  $|\cos\theta| < 0.98$
  - The track angle is required to be  $|\cos\theta_{\text{lep}}| < 0.95$

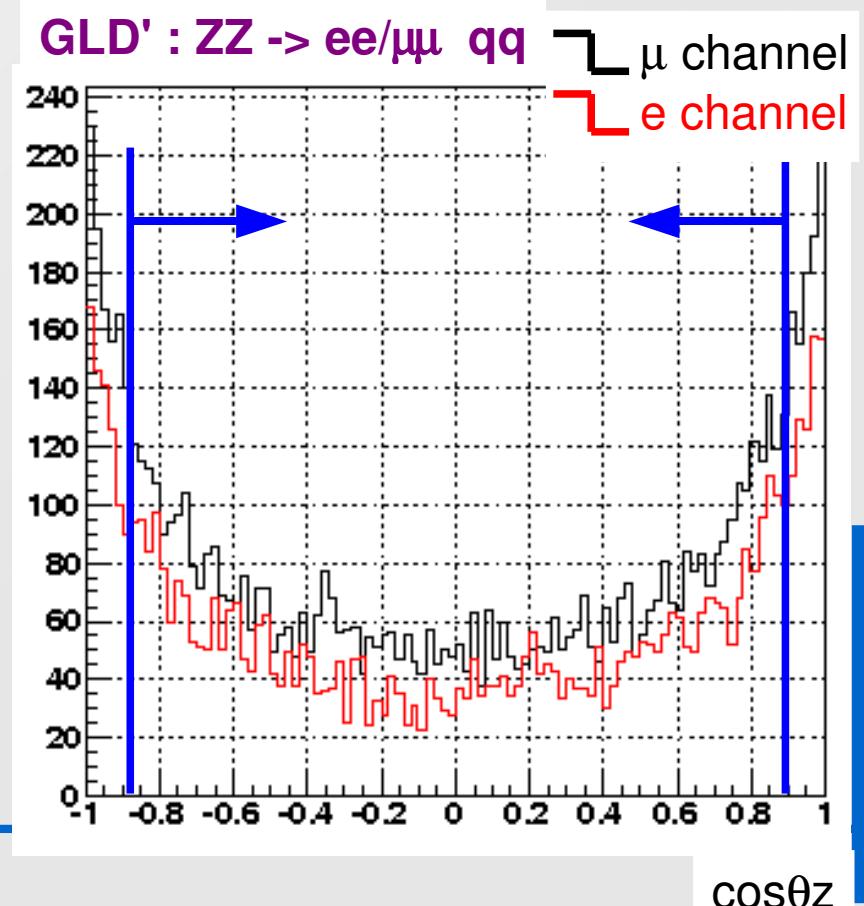

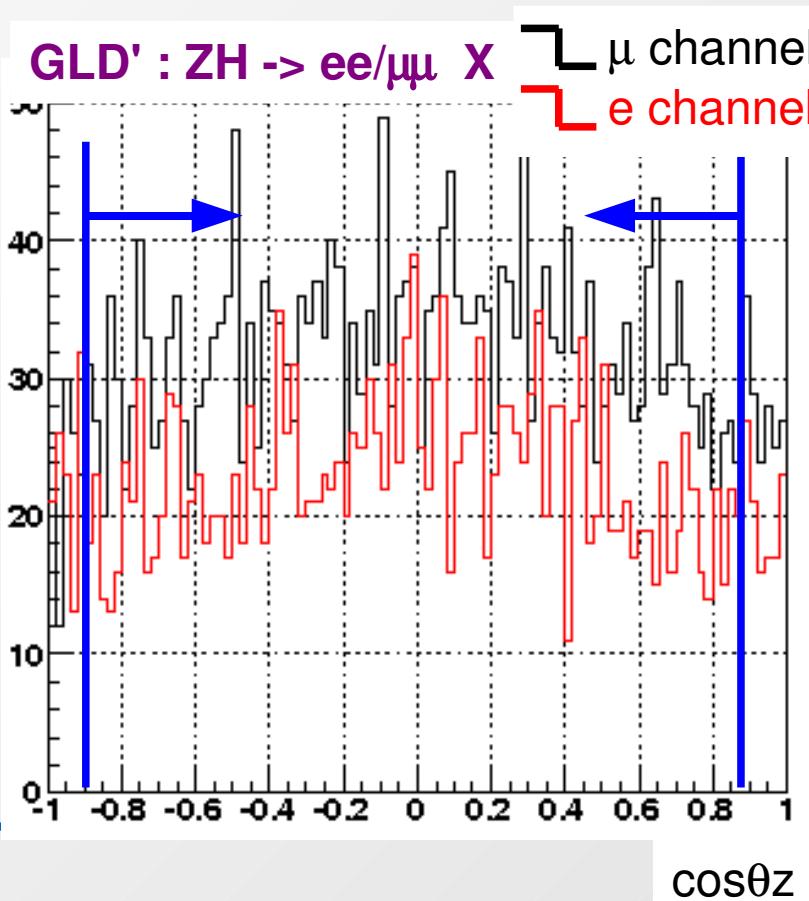

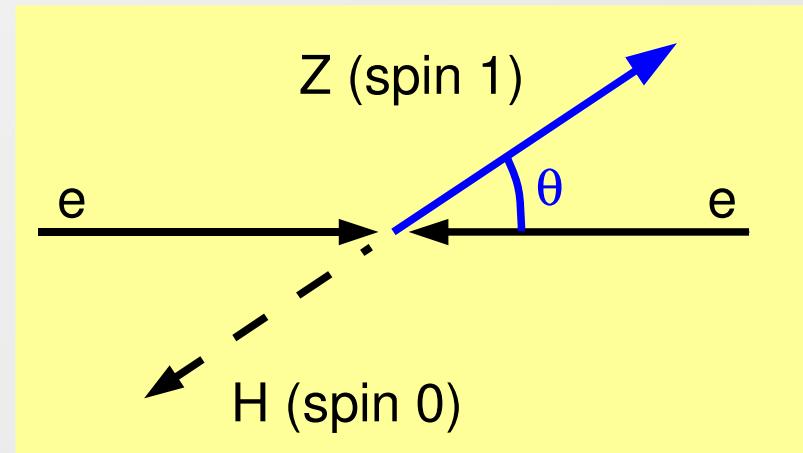

## Cut for total energy deposit

- The total energy deposit in the calorimeter was checked.
- The event of total energy above 160 GeV is selected.
  - $E_{CM} - M_z \sim 160$  GeV

## Z production angle cut

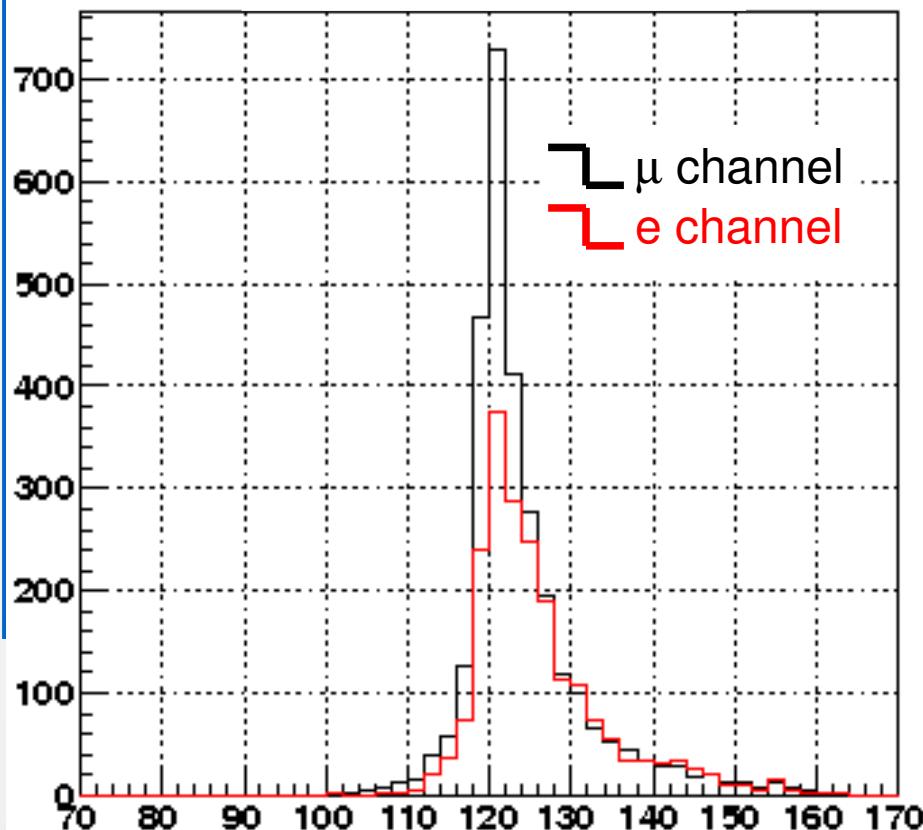

- The Z production angle cut is applied.
  - The events in the range of  $|\cos\theta_Z| < 0.9$  are selected.
  - This cut position is tentative.

## Reconstructed recoil mass

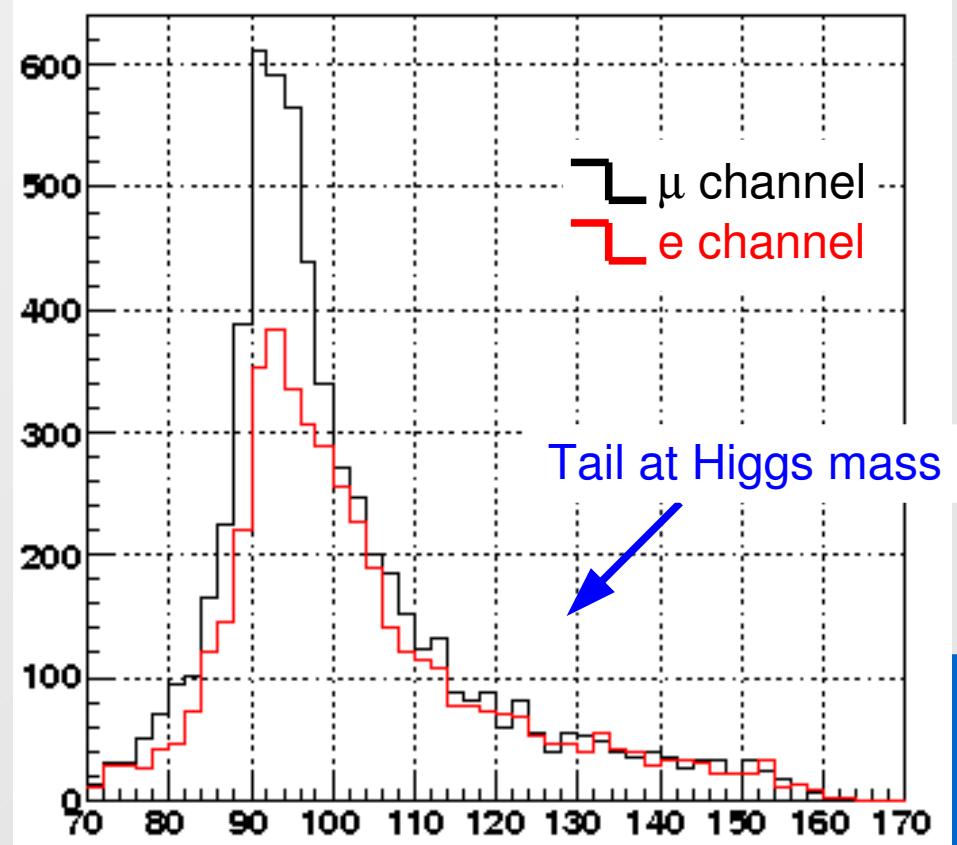

- The recoil mass is reconstructed after all the cuts.
  - A peak is observed at 120GeV for signal events.
  - There is a tail from B.G. at Higgs mass.

GLD' :  $ZH \rightarrow ee/\mu\mu X$

recoil mass[GeV]

GLD' :  $ZZ \rightarrow ee/\mu\mu qq$

recoil mass[GeV]

## Reduction summary of electron channel

- The reduction rate of electron channel is summarized for each cut.

ZH -> eeX	GLD	GLD pirme	J4LDC
No cut	5000	5000	5000
2 tracks from Z	3949(79.0%)	3904(78.1%)	3939(78.8%)
85<Mz<97	2594(51.9%)	2559(51.2%)	2626(52.5%)
$\cos \theta_{\text{lep}} < 0.95$	2350(47.0%)	2325(46.5%)	2379(47.6%)
Evis > 160GeV	2295(45.9%)	2280(45.6%)	2340(46.8%)
$\cos \theta_z < 0.9$	2082(41.6%)	2071(41.4%)	2128(42.6%)

ZZ -> ee qq	GLD	GLD pirme	J4LDC
No cut	53000	53000	52340
2 tracks from Z	31530(59.5%)	31583(59.6%)	30903(59.8%)
85<Mz<97	17548(33.1%)	17805(33.6%)	17460(33.8%)
$\cos \theta_{\text{lep}} < 0.95$	16014(30.2%)	16324(30.8%)	15976(30.9%)
Evis > 160GeV	15974(30.1%)	16300(30.8%)	15947(30.9%)
$\cos \theta_z < 0.9$	12368(23.3%)	12598(23.8%)	12289(23.8%)

Signal acceptance : ~42%  
B.G. acceptance : ~24%

## Reduction summary of muon channel

- The reduction rate of muon channel is summarized for each cut.

ZH -> mmH	GLD	GLD pirme	J4LDC
No cut	5000	5000	5000
2 tracks from Z	4470(89.4%)	4472(89.4%)	4436(88.7%)
85<M <sub>Z</sub> <97	3581(71.6%)	3584(71.7%)	3575(71.5%)
cos θ <sub>lep</sub> < 0.95	3203(64.1%)	3214(64.3%)	3204(64.1%)
E <sub>vis</sub> > 160GeV	3154(63.1%)	3170(63.4%)	3158(63.2%)
cos θ <sub>z</sub> < 0.9	2891(57.8%)	2921(58.4%)	2898(58.0%)

ZZ -> mmqq	GLD	GLD pirme	J4LDC
No cut	53000	53000	52340
2 tracks from Z	35876(67.7%)	35640(67.2%)	34626(67.0%)
85<M <sub>Z</sub> <97	23866(45.0%)	23892(45.1%)	23280(45.0%)
cos θ <sub>lep</sub> < 0.95	21563(40.7%)	21627(40.8%)	20998(40.6%)
E <sub>vis</sub> > 160GeV	21529(40.6%)	21587(40.7%)	20969(40.6%)
cos θ <sub>z</sub> < 0.9	16658(31.4%)	16610(31.3%)	16212(31.4%)

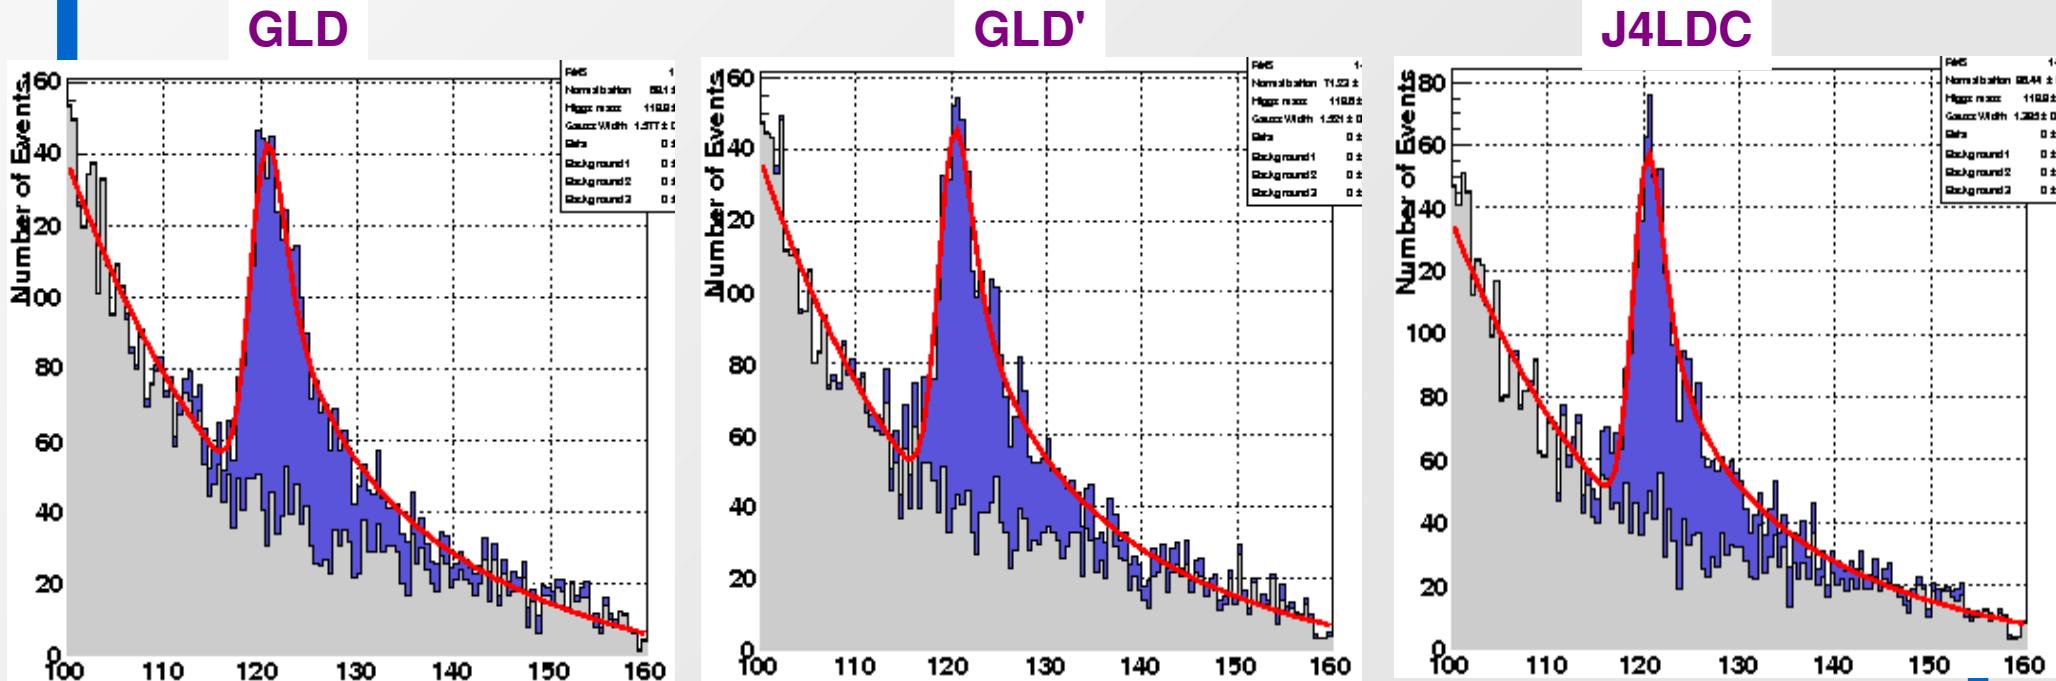

Signal acceptance : ~58%  
B.G. acceptance : ~31%

## Fitting result

- The distribution of the recoil mass is fitted by the empirical function:

$$F(m) = N_H \int F_H(m, t) e^{\frac{-t^2}{2\sigma^2}} dt + F_Z(m)$$

$$\left[ \begin{aligned} F_H(m, t) &= \left( \frac{m+t-M_h}{\sqrt{s}-M_h} \right)^{-\frac{1}{2}} \\ \beta &= \frac{2\alpha}{2\pi \log \sqrt{s}/m_e - 1} \end{aligned} \right]$$

Measurement accuracy of  $\sigma(ZH)$  and Higgs mass are estimated from the fitting result.

## Estimation of measurement accuracy

- Measurement accuracy of  $\sigma(ZH)$  and  $M_H$  is evaluated from the fitting result.
- Measurement accuracy for  $250\text{fb}^{-1}$ 
  - ZH cross-section : 1.9% (for GLD)  
1.8% (for GLD')  
2.0% (for J4LDC)
  - Higgs mass: 119MeV (for GLD)  
110MeV (for GLD')  
95.7MeV (for J4LDC)
- **Measurement accuracy of  $\sigma(ZH)$  is the same level for GLD, GLD' and J4LDC.**
- **For J4LDC, the resolution of  $M_H$  is better than GLD and GLD'.**
  - This results would come from the difference in the magnetic field.
  - It might change with the different diffusion term of TPC.
- The resolution of  $M_H$  is worse than previous study (@TILC08) because the initial beam spread becomes wider.
  - $\sigma(\Delta E/E)=0.05\% \rightarrow \sigma(e^-)=0.28\%, \sigma(e^+)=0.18\%$ .

## Summary

- Study of ZH recoil mass is ongoing for GLD, GLD' and J4LDC.
- The recoil mass distribution is reconstructed after the selection cuts.
  - $M_z$ , track angle, total energy and production angle.
- The measurement accuracy of ZH cross-section and Higgs mass is estimated for  $250\text{fb}^{-1}$ .
  - Cross-section :  $\sim 1.9\%$
  - Higgs mass :  
 $119\text{MeV}$  (GLD),  $110\text{MeV}$  (GLD'),  $95.7\text{MeV}$  (J4LDC)

## Plans

- Progress of the optimization study for ILD.
- Estimation of other B.G. (e.g.  $ee \rightarrow WW \rightarrow ee ee$ )

## Detector geometry

Previous study @TILC08

		GLD	GLD'	J4LDC
