Plan:

- 1. $\sin 2(\phi 1/eta)$ by $(car c)K_{S,L}$ modes
- 2. $\sin 2(\phi 1/\beta)$ by $b \to s$ penguin modes
- 3. $\sin 2(\phi_2/\alpha)$ by $\pi\pi$ modes
- 4. Modes related to ϕ_3/γ
- 5. Future prospects

(In the $\Upsilon 4S$ frame) $E_B = 5.28$ GeV and $|\vec{P}_B| = 0.35$ GeV/c are known. Use energy-momentum conservation:

•
$$E_B = \Sigma_i^n E_i \rightarrow \Delta E \equiv E_B - E_{\text{beam}}$$

• $\vec{P}_B = \Sigma_i^n \vec{P}_i \rightarrow M_{bc} \equiv \sqrt{E_{\text{beam}}^2 - P_B^2}$

(In the lab. frame: no need to boost) $q_{\Upsilon} = (E_{\Upsilon}, \vec{P}_{\Upsilon}), \quad q_B = (E_B, \vec{P}_B)$

•
$$M_{ES} = \sqrt{s/2 + \vec{P}_{\Upsilon} \cdot \vec{P}_B)^2 / E_{\Upsilon}^2 - \vec{P}_B^2}$$

• $\Delta E = (q_{\Upsilon} \cdot q_B) / \sqrt{s} - \sqrt{s}$

 $M_{bc} = M_{ES}$ if masses are correct.

 $q=+1~{\rm Tag}$ side is B^0 , $\qquad \xi_f:{\rm CP}$ eigenvalue. -1 for $J/\Psi K_S$

We observed:

If the tagside is B^0 , the $J/\Psi K_S$ side tends to decay later than the tagside.

If the tagside is \overline{B}^0 , the $J/\Psi K_S$ side tends to decay later than the tagside. :Inconsistent with observation.

Deviation therefrom \rightarrow new physics in $b \rightarrow s$ (e.g. the W-loop replaced by a charged Higgs loop)

Continuum Suppression

Most rare modes: background is dominated by continuum $e^+e^- \rightarrow q\bar{q}$ 2-jet events.

- Event shape variables: Fox-Wolfram R_l , thrust, etc. continuum: skinny, $B\bar{B}$: spherical.
- Angle(B candidate axis, axis of the rest) continuum: aligned, $B\overline{B}$: uniform.
- Angle(*B*, beam) continuum: $1 + \cos^2 \theta$, *B*: $\sin^2 \theta$.
- Fisher: $F = \sum_i c_i X_i$ (above+ X_i energy flow etc.) Adjust c_i to maximize the separation.

On the other hand,

Expect $B \to K\bar{K}K$ to be dominated by $b \to s$ penguin. In fact: since no $b \to s$ penguin (odd s/\bar{s}) in $K\bar{K}\pi$ (even s/\bar{s}),

$$F \equiv rac{\Gamma_{b o u}^{3K}}{\Gamma_{ ext{total}}^{3K}} \sim rac{\mathcal{B}(K^+K^-\pi^+)}{\mathcal{B}(K^+K^-K^+)} \left(rac{f_K}{f_\pi}

$$2r\sin\phi_3\sin\delta=rac{A_1-A_2}{2}=0.15\pm0.12\,.$$

$B \rightarrow$ non-charm Rate Asymmetries

Direct CPV by tree-penguin interference.

e.q. for $K^-\pi^0$:

Statistically more favorable than DK modes, but theoretically challenging.

Future: use theoretical models (PQCD, QCD factorization, Charming penguin, etc.) for A_{CP} and Br's to extract ϕ_3 .

Remarks on $B \rightarrow$ non-charm Rate Asymmetries

- Some modes are penguine-dominated. $(K^0\pi^+,~\eta'K^+) \rightarrow A_{CP} \sim 0.~{
 m OK}.$
- $A_{CP}(\eta \pi^+) = -0.51 \pm 0.20$ significant? $\eta \pi^+, \eta K^+, \eta' \pi^+$ are thoretically expected to have large A_{CP} . Interesting to see more stat.
- Theoretical uncertainties are still large.

- 1. Tevatron Run2. (CDF, D0)
 - 150 pb⁻¹ now \rightarrow 4-5 fb⁻¹ by LHC (2007)
 - With 2 fb⁻¹ (+ B_s , Λ_b physics) $\sigma_{\sin 2\beta} \sim 0.06$ (~B-factory now, different sys.) $\sigma_{A_{CP}(K^+\pi^-)} \sim 1 \sim 10\%$.
- 2. LHC. (ATLAS, CMS)
 - \bullet B-physics while intensity is not too high.
 - $\sigma_{\sin 2lpha_{

Summary

- CPV in charmonium $K_{S,L}$ modes firmly established. $\sin 2(\phi_1/\beta) = 0.736 \pm 0.049$ cosistent with SM.
- Hint of deviation of " $\sin 2\phi_1$ " (ϕK_S) from SM by Belle, but not by BaBar.
- HInt of direct CPV in $\pi^+\pi^-$ by Belle, but not by BaBar.
- Hint of direct CPV in $\rho^+\pi^-$ (BaBar).
- Accuracy of ϕ_3/γ by $D^{(*)}\pi$ modes is becoming meaningful.
- Sensitivity in A_{CP} of DK modes is approaching interesting region.
- No clear direct CPV in rate asymmetries A_{CP} , except for some hint in $\eta \pi^+$.
